Module Index

1.1 Modules

Here is a list of all modules:

shooSH .																			5
Builtin																			5
Initializer .																			8
Parser																			9
Redirector																			9
shooSHlib																			9

2 Module Index

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

xecutor (Classe que executa os comandos)	. 11
ob (Classe de Job)	. 12
Parser (Parser de linha)	. 13
^P iper	. 14
Process	. 15
Redirector	. 15

4 Class Index

Module Documentation

3.1 shooSH

Functions

void shooSH_init (void)

Funcao de inicializacao da Shell.

• void shooSH_clean (void)

Funcao para liberar os recursos alocados pela Shell.

void shooSH_run (void)

Funcao que executa a Shell.

Variables

• int currID

ID do ultimo Job criado.

3.1.1 Detailed Description

Funcoes globais utilizadas pela shell. }@

3.2 Builtin

Functions

• void jobs (void)

Mostra todos os jobs da lista.

void showHistory (void)

Mostra comandos digitados ate o momento.

• void sendsigterm (int id)

Envia um sinal SIGTERM para o job dado por id.

• void echo (int argc, char *args[])

Escreve os argumentos com 1 espaco entre eles.

void changeDirectory (const char *dir)

Muda o diretorio atual.

void showDirectoryName (void)

Mostra o diretorio atual.

Exceptions

- -1 Diretorio maior que 256 caracteres.
- void foreground (int id)

Coloca o job em execucao em foreground.

void background (int id)

Coloca o job em execucao em background.

• int executeBuiltin (Process *p)

Executa comandos builtin.

Variables

• std::list< std::string > history

Historico de comandos.

3.2.1 Detailed Description

Funcoes integradas }@

3.2.2 Function Documentation

3.2.2.1 void background (int id)

Coloca o job em execucao em background.

Parameters

id ID do job.

Exceptions

-ID Job nao encontrado.

3.2 Builtin 7

3.2.2.2 void changeDirectory (const char * dir)

Muda o diretorio atual.

Parameters

dir Diretorio para o qual ocorrera a mudanca.

3.2.2.3 void echo (int argc, char * args[])

Escreve os argumentos com 1 espaco entre eles.

Parameters

argc	Numero de palavras a serem escritas + 1.
args	Palavras a serem escritas, comeca com "echo".

3.2.2.4 int executeBuiltin (Process * p)

Executa comandos builtin.

Parameters

p Processo a ser executado.

Returns

0 Comando nao eh builtin 1 Faltam parametros 2 Erro nos parametros 0 Sucesso

3.2.2.5 void foreground (int id)

Coloca o job em execucao em foreground.

Parameters

id ID do job.

Exceptions

-ID Job nao encontrado.

3.2.2.6 void sendsigterm (int id)

Envia um sinal SIGTERM para o job dado por id.

Generated on Tue Nov 15 2011 21:06:40 by Doxygen

Parameters

id ID do job.

Exceptions

-id Job inexistente.

3.3 Initializer

Functions

void hanchld (int signum, siginfo_t *siginfo, void *context)

Handler para sinais de processos filhos.

• void hanttin (int signum, siginfo_t *siginfo, void *context)

Handler para o sinal SIGTTIN.

• void hanttou (int signum)

Handler para o sinal SIGTTOU.

void init_tty (void)

Inicializa sinais e entrega o terminal para shell.

Variables

• std::list < Job * > jobList

Lista de Jobs da shell.

• struct termios shooSHTermios

Atributos da shell.

• pid_t shooSHPGID

Group ID da shell.

• struct sigaction sa_chld

Estrutura para o sinal SIGCHLD.

• struct sigaction sa_ttin

Estrutura para o sinal SIGTTIN.

• struct sigaction sa_ttou

Estrutura para o sinal SIGTTOU.

3.3.1 Detailed Description

Atributos da shell e funcoes de inicialização. }@

3.4 Parser 9

3.4 Parser

Defines

- #define NUM WORDS 100
- #define MAX_LENGTH 1024
- #define MAX_FILENAME 128
- #define PARSCMD 0
- #define PARSNEXT 1
- #define PARSPARAM 2
- #define PARSRIN 3
- #define PARSROUT 4
- #define PARSTWO 5
- #define PARSRERR 6
- #define PARSFILENAME 7
- #define PARSSUCCESS 8
- #define PARSFAIL 9

3.4.1 Detailed Description

Definicoes de limites e estados da maquina de estados.

3.5 Redirector

Defines

- #define REDIN 1
- #define REDOUTT 2
- #define REDOUTA 4
- #define REDERRT 8
- #define REDERRA 16

3.5.1 Detailed Description

Definicoes de flags de redirecionamento

3.6 shooSHlib

Defines

- #define shooSH_EXIT 1
- #define shooSH_PIPE 2

- #define shooSH_REDIR 4
- #define shooSH_NOP 8
- #define shooSH_FAIL 16
- #define shooSH_BG 32

3.6.1 Detailed Description

Definicoes de flags da shell

Class Documentation

4.1 Executor Class Reference

Classe que executa os comandos.

```
#include <Executor.hpp>
```

Public Member Functions

• void execute (Job *job)

Executa um job.

4.1.1 Detailed Description

Classe que executa os comandos.

Executor

4.1.2 Member Function Documentation

```
4.1.2.1 void Executor::execute ( Job * job ) [inline]
```

Executa um job.

Parameters

```
job Ponteiro para o job a ser executado.
```

Exceptions

-1	Ocorreu um erro no fo	ork.
----	-----------------------	------

The documentation for this class was generated from the following file:

· Executor.hpp

4.2 Job Class Reference

Classe de Job.

```
#include <Job.hpp>
```

Public Member Functions

• void createProcess (void)

Cria um processo e o insere no vetor de processos.

void destroy (void)

Desaloca todos os recursos.

- std::string getCommand (void)
- int getID (void)
- pid_t getPGID (void)
- Process * getProcess (int i)

Retorna um processo do vetor de processos.

- struct termios * getTermios (void)
- bool hasPipe (void)
- bool hasExited (void)
- bool hasFailed (void)
- bool inBG (void)
- bool isNop (void)
- bool isStopped (void)
- int size (void)
- · void addFlag (int)
- · void cont (void)
- · void setBG (bool)
- void setCommand (std::string command)
- void setID (int)
- void setPGID (pid_t)
- void setProcessCommand (char **command, int size)

Seta o comando do ultimo processo inserido.

• void setProcessFile (std::string filename, int flag)

Seta o nome do arquivo relacionado a um tipo de redirecionamento.

- void stop (void)
- void print (void)

4.2.1 Detailed Description

Classe de Job.

4.2.2 Member Function Documentation

4.2.2.1 Process * Job::getProcess (int i)

Retorna um processo do vetor de processos.

Parameters

i	Indice do processo no vetor.

4.2.2.2 void Job::setProcessCommand (char ** command, int size)

Seta o comando do ultimo processo inserido.

Parameters

command	Matriz de caracteres cuja ultima linha deve ser (char*)NULL.
size	Numero de linhas da matriz sem contar a nula.

4.2.2.3 void Job::setProcessFile (std::string filename, int flag)

Seta o nome do arquivo relacionado a um tipo de redirecionamento.

Parameters

filename	Nome do arquivo.
flag	Flag indicando o tipo de redirecionamento

The documentation for this class was generated from the following files:

- lib/Job.hpp
- lib/Job.cpp

4.3 Parser Class Reference

Parser de linha.

```
#include <Parser.hpp>
```

Public Member Functions

Job * parseLine (void)

Pega uma linha de comando. Implementada como uma maquina de estados para reconhecer a linguagem gerada pela gramatica indicada na especificacao.

4.3.1 Detailed Description

Parser de linha.

4.3.2 Member Function Documentation

```
4.3.2.1 Job * Parser::parseLine (void)
```

Pega uma linha de comando. Implementada como uma maquina de estados para reconhecer a linguagem gerada pela gramatica indicada na especificacao.

Returns

Ponteiro para o job gerado.

The documentation for this class was generated from the following files:

- · lib/Parser.hpp
- · lib/Parser.cpp

4.4 Piper Class Reference

```
#include <Piper.hpp>
```

Public Member Functions

void execPipe (Job *job)

Executa um job com pipe. Implementada como uma fila invertida, ou seja, o primeiro comando a ser executado sera o processo com maior PID.

4.4.1 Detailed Description

Classe para execucao de comandos com pipe.

4.4.2 Member Function Documentation

```
4.4.2.1 void Piper::execPipe ( Job * job ) [inline]
```

Executa um job com pipe. Implementada como uma fila invertida, ou seja, o primeiro comando a ser executado sera o processo com maior PID.

Parameters

job	Ponteiro para o job a ser executado

Exceptions

```
-1 Erro no fork
```

The documentation for this class was generated from the following file:

· Piper.hpp

4.5 Process Class Reference

```
#include <Process.hpp>
```

Public Member Functions

void destroy (void)

Desaloca a matriz de comandos.

- bool hasRedirection (void)
- void setCommand (char **, int)
- void setFilename (std::string, int)
- void setPID (pid_t)
- char ** getCommand (void)
- std::string * getFilenames (void)
- pid t getPID (void)
- int * getRedirFlags (void)
- int size (void)
- void print (void)

4.5.1 Detailed Description

Classe de processo

The documentation for this class was generated from the following files:

- · lib/Process.hpp
- lib/Process.cpp

4.6 Redirector Class Reference

```
#include <Redirector.hpp>
```

Public Member Functions

• void init (std::string filename[3], int flag[3])

Abre os arquivos necessarios e duplica descritores.

void end (void)

Fecha os descritores de arquivos.

4.6.1 Detailed Description

Classe com funcoes de redirecionamento

4.6.2 Member Function Documentation

4.6.2.1 void Redirector::init (std::string filename[3], int flag[3])

Abre os arquivos necessarios e duplica descritores.

Parameters

filename	Nomes dos arquivos.
flag	Flags indicando os tipos de redirecionamento

The documentation for this class was generated from the following files:

- lib/Redirector.hpp
- lib/Redirector.cpp
